

NOXTEMP

Temp Mail, Real Privacy

Client Feature Brief

Android temporary email app with live inbox, OTP detection, secure backend API, and custom domain routing.

Status	Platform	Backend	API
Completed	Android	Live	Secured

Project Overview

NOXTEMP is a disposable email Android application designed for quick verification, anonymous signups, and privacy-friendly temporary inbox usage. The app generates temporary email addresses using custom domains and displays received emails through a live backend connected to Supabase.

Core App Features

Temporary Email Generation

Generates new temporary addresses using custom domains: apknox.online and noxzone111.online.

- ✓ Custom domain support
- ✓ Unique per session
- ✓ Fully disposable

Persistent Email Session

Current email stays active when the app is closed or reopened — no session loss.

- ✓ Session persists on restart
- ✓ New address only on user tap
- ✓ Seamless UX

Auto Refresh — Live Inbox

Inbox automatically refreshes every 15 seconds inside the app.

- ✓ Real-time incoming emails
- ✓ 15-second polling interval
- ✓ Manual refresh also available

10-Minute Expiry Timer

Email address expires after 10 minutes with an automatic cleanup request sent to backend.

- ✓ Visual countdown timer
- ✓ Auto cleanup on expiry
- ✓ Privacy protected

■ One-Tap Copy

Generated email address is copied to clipboard instantly with a single tap.

- ✓ One-tap copy button
- ✓ Fast sharing
- ✓ No manual typing needed

■ Polished Dark UI

Privacy-focused dark UI with custom NOXTEMP branding, splash logo, and smooth experience.

- ✓ Custom splash screen
 - ✓ NOXTEMP branding
 - ✓ Material dark design
-

■ Inbox & Email Experience

■ Clean Inbox Cards

Each email shows sender, subject, timestamp, and a preview — clean and readable at a glance.

- ✓ Sender + Subject visible
- ✓ Time display
- ✓ Email preview snippet

■ OTP / Code Detection

Automatically detects OTP and verification codes from subject line and email body.

- ✓ Scans subject and body
- ✓ Highlighted OTP badge in inbox
- ✓ Tap badge to copy instantly

■ Email Detail Screen

Full email view with a separate highlighted code panel and clickable links.

- ✓ Dedicated code panel
- ✓ Clickable links open browser
- ✓ Full email content view

■ Smart Empty State

When inbox is empty, a clear INBOX EMPTY message with "Waiting for incoming mail" is shown.

- ✓ Clear empty state UI
 - ✓ No confusing blank screen
 - ✓ User-friendly feedback
-

■ Backend & Email Flow

■ Cloudflare Email Routing

Domain emails are forwarded to Gmail inboxes via Cloudflare Email Routing.

- ✓ apknox.online domain
- ✓ noxzone111.online domain
- ✓ Reliable forwarding

■ Gmail IMAP Polling

Backend polls Gmail IMAP every 30 seconds for new unread emails.

- ✓ 30-second polling interval
- ✓ Filters by inbox address
- ✓ Low IMAP risk strategy

■ Duplicate Prevention

Before saving, the system checks sender, subject, and recipient to prevent duplicate entries.

- ✓ Triple-field check
- ✓ No duplicate emails
- ✓ Clean inbox guaranteed

■ Supabase Database

Active inboxes and received emails are stored in Supabase with two dedicated tables.

- ✓ inboxes table
- ✓ emails table
- ✓ Scalable and reliable

■ Render Hosting + UptimeRobot

Backend is hosted on Render. UptimeRobot keeps it warm using the /health endpoint.

- ✓ Live backend on Render
- ✓ UptimeRobot monitoring
- ✓ /health endpoint active

■ API Features for Partner Apps

Endpoint	Method	Purpose
/generate	POST	Generate a new temporary email address
/inbox/:address	GET	Fetch inbox messages for a generated address
/emails/:address	GET	Fetch emails for Android app legacy flow
/inbox/:address	DELETE	Delete inbox and all related emails
/health	GET	Health check for uptime monitoring

API Security & Rate Limits

■ API Key Protection

Partner endpoints are secured with x-api-key header authentication.

- ✓ x-api-key header required
- ✓ Unauthorized requests blocked
- ✓ Per-partner key management

■ Rate Limiting

Endpoints are rate-limited to prevent abuse and maintain backend stability.

- ✓ Generate: 5 req/min per IP
- ✓ Inbox: 30 req/min per IP
- ✓ 30-second backend polling interval

■ Technical Stack

Layer	Technology
Android App	Kotlin, XML Layouts, Material Components, RecyclerView, WebView
Backend	Node.js, Express, IMAP, Mailparser, Node Cron
Database	Supabase — tables: inboxes and emails
Email Routing	Cloudflare Email Routing + Gmail IMAP
Hosting	Render web service
Monitoring	UptimeRobot /health monitor

■ Delivery Status

✓	Android debug build verified successfully
✓	Signed release APK workflow prepared in Android Studio
✓	Live backend deployed and tested
✓	Email generation API tested successfully
✓	Inbox API tested with real email delivery
✓	End-to-end mail receiving flow confirmed

Client Notes

This build is ready for small-scale usage and testing. The current free-tier setup is suitable for limited users. Main external dependencies include Render, Supabase, Cloudflare Email Routing, and Gmail IMAP availability.
